# 8th Edition Lung Cancer TNM Staging Summary 

| T - Primary Tumor |  |  |
| :---: | :---: | :---: |
| TX |  | Primary tumor cannot be assessed, or tumor proven by the presence of malignant cells in sputum or bronchial washings but not visualized by imaging or bronchoscopy |
| T0 |  | No evidence of primary tumor |
| Tis |  | Carcinoma in situ |
| T1 |  | Tumor 3 cm or less in greatest dimension, surrounded by lung or visceral pleura, without bronchoscopic evidence of invasion more proximal than the lobar bronchus (i.e., not in the main bronchus) ${ }^{1}$ |
|  | T1mi | Minimally invasive adenocarcinoma ${ }^{2}$ |
|  | T1a | Tumor 1 cm or less in greatest dimension ${ }^{1}$ |
|  | T1b | Tumor more than 1 cm but not more than 2 cm in greatest dimension ${ }^{1}$ |
|  | T1c | Tumor more than 2 cm but not more than 3 cm in greatest dimension ${ }^{1}$ |
| T2 |  | Tumor more than 3 cm but not more than 5 cm ; or tumor with any of the following features:3 <br> - Involves main bronchus regardless of distance to the carina, but without involving the carina <br> - Invades visceral pleura <br> - Associated with atelectasis or obstructive pneumonitis that extends to the hilar region, either involving part of the lung or the entire lung |
|  | T2a | Tumor more than 3 cm but not more than 4 cm in greatest dimension |
|  | T2b | Tumor more than 4 cm but not more than 5 cm in greatest dimension |
| T3 |  | Tumor more than 5 cm but not more than 7 cm in greatest dimension or one that directly invades any of the following: chest wall (including superior sulcus tumors), phrenic nerve, parietal pericardium; or associated separate tumor nodule(s) in the same lobe as the primary |
| T4 |  | Tumors more than 7 cm or one that invades any of the following: diaphragm, mediastinum, heart, great vessels, trachea, recurrent laryngeal nerve, esophagus, vertebral body, carina; separate tumor nodule(s) in a different ipsilateral lobe to that of the primary |

## N - Regional Lymph Nodes

| NX  <br> Regional lymph nodes cannot be assessed  <br> N0  <br> No regional lymph node metastasis  <br> N1  <br> Metastasis in ipsilateral peribronchial and/or <br> ipsilateral hilar lymph nodes and intrapulmonary <br> nodes, including involvement by direct extension  <br> N2  <br> Metastasis in ipsilateral mediastinal and/or <br> subcarinal lymph node(s)  <br> N3  <br> Metastasis in contralateral mediastinal, <br> contralateral hilar, ipsilateral, or contralateral <br> scalene, or supraclavicular lymph node(s)  |  |  |
| :--- | :--- | :--- |

## M- Distant Metastasis

| M0 |  | No distant metastasis |
| :--- | :--- | :--- |
| M1 |  | Distant metastasis |
|  | M1a | Separate tumor nodule(s) in a contralateral lobe; <br> tumor with pleural or pericardial nodules or <br> malignant pleural or pericardial effusion |
|  | M1b | Single extrathoracic metastasis in a single organ ${ }^{5}$ |
|  | M1c | Multiple extrathoracic metastases in one or <br> several organs |

${ }^{1}$ The uncommon superficial spreading tumor of any size with its invasive component limited to the bronchial wall, which may extend proximal to the main bronchus, is also classified as T1a.
${ }^{2}$ Solitary adenocarcinoma $(</=3 \mathrm{~cm})$, with a predominantly lepidic pattern and $</=5 \mathrm{~mm}$ invasion in greatest dimension.
${ }^{3} T 2$ tumors with these features are classified $T 2$ a if 4 cm or less, or if size cannot be determined and T2b if greater than 4 cm but not larger than 5 cm .
${ }^{4}$ Most pleural (pericardial) effusions with lung cancer are due to tumor. In a few patients, however, multiple microscopic examinations of pleural (pericardial) fluid are negative for tumor, and the fluid is non-bloody and is not an exudate. Where these elements and clinical judgement dictate that the effusion is not related to the tumor, the effusion should be excluded as a staging descriptor. ${ }^{5}$ This includes involvement of a single distant (non-regional) node.

Visceral Pleural Invasion. PLO indicates tumor within the subpleural lung parenchyma or invading superficially into the pleural connective tissue; PL1, tumor invades beyond the elastic layer; PL2, tumor invades the pleural surface; PL3, tumor invades any component of the parietal pleura. PL1 \& PL2 $=\mathrm{T} 2$ and PL3 $=\mathrm{T} 3$. Copyright ©2016 Aletta Ann Frasier, MD.

| Supraclavicular zone |
| :---: |
| 1Low cervical, supraclavicular, <br> and sternal notch nodes |

SUPERIOR MEDIASTINAL NODES

| Upper zone |
| :--- |
| 2R Upper Paratracheal (right) |
| 2L Upper Paratracheal (left) |
| 3a Prevascular |
| 3p Retrotracheal |
| 4R Lower Paratracheal (right) |
| 4L Lower Paratracheal (left) |

AORTIC NODES

| 5 Subaortic |
| :---: | :---: |
| 6 Para-aortic (ascending aorta or |
| phrenic) |

## INFERIOR MEDIASTINAL NODES

| 7 Subcarinal |
| :---: |
| Subcarinal zone <br> 8 <br> 9 |
| Paraesor zone |

N1 NODES

| 10 Hilar |
| :--- |
| 11 Interlobar |

## IASLC Nodal Chart with Stations and Zones

N 1 a : involvement of a single N 1 nodal station;
N 1 b : involvement of multiple N 1 nodal stations;
N2a1: involvement of a single N2 nodal station without N 1 involvement;

N2a2: involvement of a single N2 nodal station with N 1 involvement; and

N2b: involvement of multiple N2 nodal stations.
